

In today's brief:

- Dosimetry Update
- Sellafield Web Updates

Changes to dosimetry arrangements (reissue 14 April)

External dosimeters

The wear period of currently issued dosimeters is being extended until 30 June.

This applies to:

- Quarterly and monthly whole body dosimeters - Neutron dosimeters - Extremity TLDs (ring TLD) - Cap/collar (eyelens) dosimeters

Extending the wear period will not affect the dose recorded on your record for the year. Whole Body gamma doses will still be managed in the short term for significant dose work by wearing Electronic Dosimeters (EPDs) as normal.

Other doses are well below dose limits and this is particularly the case when the plants move to a quiescent state. Health physics team leaders can issue auxiliary dosimeters should work require it. Please ensure that dosimeters are stored in a safe/secure/low background location when not being used.

Internal monitoring programme: Requests for routine urine samples and Whole Body Monitors (WBMs) will be suspended temporarily in order to prioritise resource on any special samples / WBM measurements requested by Radiation Protection Advisors (RPAs). This will not affect the site's ability to comply with the requirements of the IRRs17 in the short term.

Any changes to these arrangements will be communicated later including arrangements for external dosimeters post 30 June.
